Spring 2013 Semester

Matthew Jones

Thin Lens Equation

Add these equations and simplify using n_m $\frac{1}{n}$ = 1 and $d \rightarrow 0$:

$$
\frac{1}{s_o} + \frac{1}{s_i} = (n_l - 1) \left(\frac{1}{R_1} - \frac{1}{R_2} \right)
$$

(Think lens equation)

Thick Lenses

- $\bullet~$ Eliminate the intermediate image distance, s_{i1}
- Focal points:
	- Rays passing through the focal point are refracted parallel to the optical axis by both surfaces of the lens
	- – $-$ Rays parallel to the optical axis are refracted through the focal point
	- $-$ For a thin lens, we can draw the point where refraction occurs in a common plane
	- – $-$ For a thick lens, refraction for the two types of rays can occur at different planes

Thick Lens: Principal Planes

Principal planes can lie outside the lens:

Thick Lens: equations

Thick Lens Calculations

1. Calculate focal length

$$
\frac{1}{f} = (n-1)\left[\frac{1}{R_1} - \frac{1}{R_2} + \frac{(n-1)d}{nR_1R_2}\right]
$$

2. Calculate positions of principal planes

$$
h_1 = -\frac{f(n-1)d}{nR_2}
$$

$$
h_2 = -\frac{f(n-1)d}{nR_1}
$$

- 3. Calculate object distance, s_o , measured from principal plane
- 4. Calculate image distance:

$$
\frac{1}{s_o} + \frac{1}{s_i} = \frac{1}{f}
$$

5. Calculate magnification, $m_T^{}= T = -s_i/s$ 0

Thick Lens: example

 Find the image distance for an object positioned 30 cm from the vertex of a double convex lens having radii 20 cm and 40 cm, a thickness of 1 cm and n_f =1.5

Compound Thick Lens

Can use two principal points (planes) and effective focal length *f*to describe propagation of rays through any compound system

Note: any ray passing through the first principal plane will emerge at the same height at the second principal plane

For 2 lenses (above):

$$
\frac{1}{f} = \frac{1}{f_1} + \frac{1}{f_2} - \frac{d}{f_1 f_2}
$$

$$
\frac{\overline{H_{11}H_1} = fd/f_2}{H_{22}H_2 = fd/f_1}
$$

Example: page 246

- Even the thick lens equation makes approximations and assumptions
	- – $-$ Spherical lens surfaces
	- – $-$ Paraxial approximation
	- – $-$ Alignment with optical axis
- The only physical concepts we applied were
	- – $-$ Snell's law: $n_i\sin\theta_i = n_t\sin\theta_t$
	- – $-$ Law of reflection: $\theta_t = \theta_i$ (in the case of mirrors)
- Can we do better? Can we solve for the paths of the rays exactly?
	- – $-$ Sure, no problem! But it is a lot of work.
	- –Computers are good at doing lots of work (without complaining)

- We will still make the assumptions of
	- – $-$ Paraxial rays

•

- – $-$ Lenses aligned along optical axis
- We will make no assumptions about the lens thickness or positions.

- At a given point along the optical axis, each ray can be uniquely represented by two numbers:
	- $-$ Distance from optical axis, ${\rm y}_i$
	- – $-$ Angle with respect to optical axis, α_i
- If the ray does not encounter an optical element its distance from the optical axis changes according tothe *transfer equation*:

$$
y_2 = y_1 + d_1 a_1
$$

 $y_2 = y_1 + d_1 \alpha_1$ $y_1 = \frac{\sqrt{\alpha_1} + \sqrt{\alpha_2}}{2\alpha_1}$

This assumes the paraxial approximation sin $\alpha_1 \approx \alpha_1$

- At a given point along the optical axis, each ray can be uniquely represented by two numbers:
	- $-$ Distance from optical axis, ${\rm y}_i$
	- – $-$ Angle with respect to optical axis, α_i
- When the ray encounters a surface of a material with a different index of refraction, its angle will change according to the *refraction equation*:

$$
n_{t1}\alpha_{t1} = n_{i1}\alpha_{i1} - D_1y_1
$$

$$
D_1 = \frac{n_{t1} - n_{i1}}{R_1}
$$

 $-$ Also assumes the paraxial approximation

•Geometry used for the refraction equation:

Matrix Treatment: Refraction

At any point of space need 2 parameters to fully specify ray:distance from axis (y) and inclination angle (α) with respect to the optical axis. Optical element changes these ray parameters.

Refraction:

$$
n_{t1}\alpha_{t1} = n_{t1}\alpha_{t1} - D_1y_{t1}
$$

 1 σ μ_i σ_{i1} σ_{i1} $y_{t1} = 0 \cdot n_{i1} \alpha_{i1} + y_{i1}$

```
note: paraxial approximationReminder:
```

$$
\begin{bmatrix} A & B \\ C & D \end{bmatrix} \begin{pmatrix} \alpha \\ y \end{pmatrix} \equiv \begin{pmatrix} A\alpha + By \\ C\alpha + Dy \end{pmatrix}
$$
